AdmissionFlow Intelligence: decisions from acquisition to enrollment

Business challenge: connect institutional campaign spending to student progression and enrollment.

Management workflow: monitor campaign efficiency, prioritize follow-up and produce consistent client reports.

Decision standard: use transparent metrics and controlled testing; synthetic associations are not real business impact.

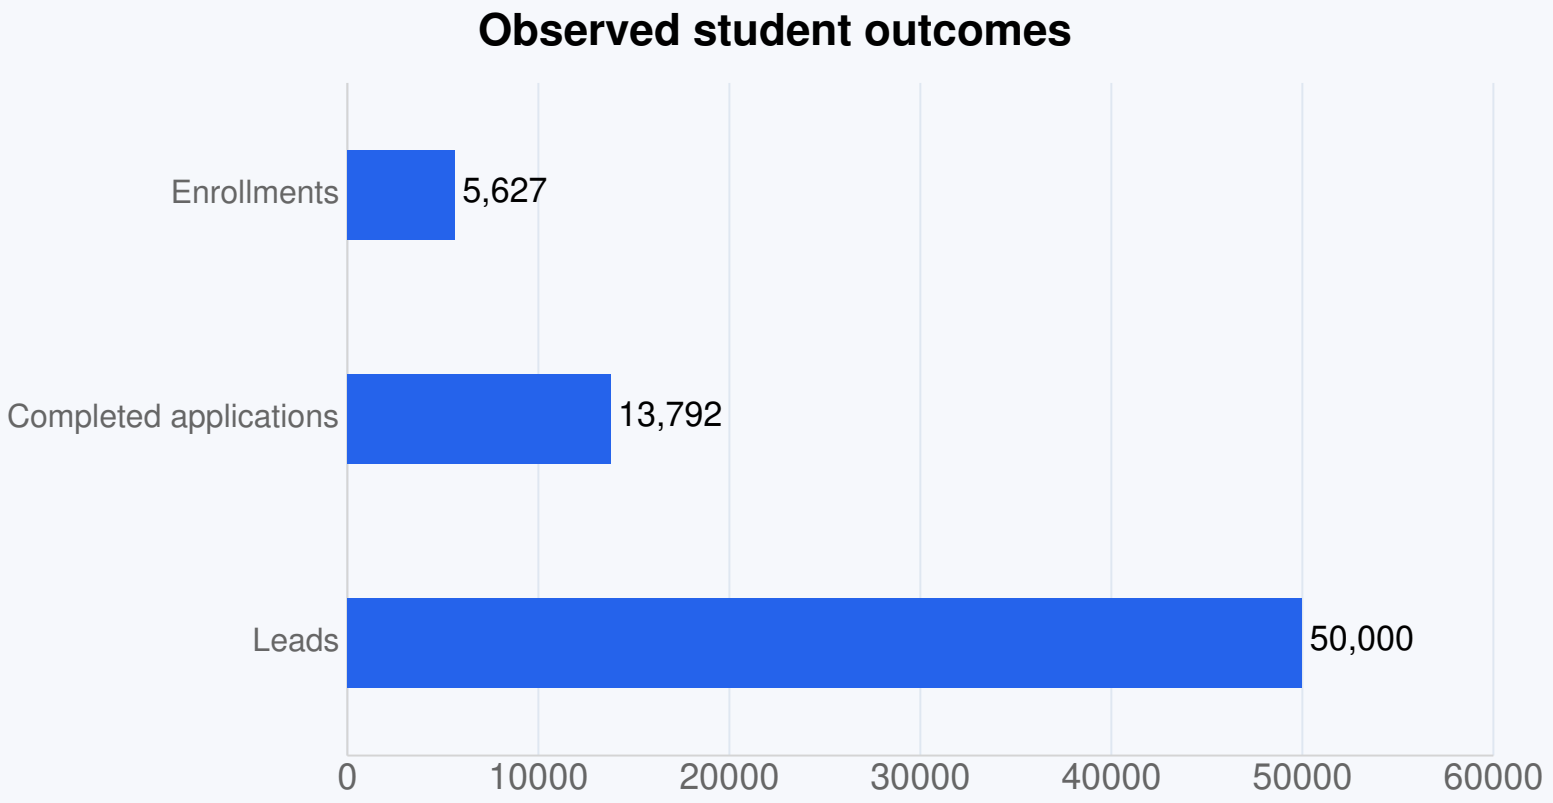

A reproducible simulation with explicit analytical boundaries

50,000 leads · 24 fictional institutions · 120 campaign-months · 7 channels · 8 markets.

Five relational tables, 12 SQL analyses and a fixed seed. Single primary campaign per lead prevents duplicated attribution.

2025 acquisition; outcomes through 31 December. Recent cohorts are incomplete; planner uses mature campaign-months only.

₹189.39 lakh spent; 5,627 confirmed enrollments observed

11.25% lead-to-enrollment

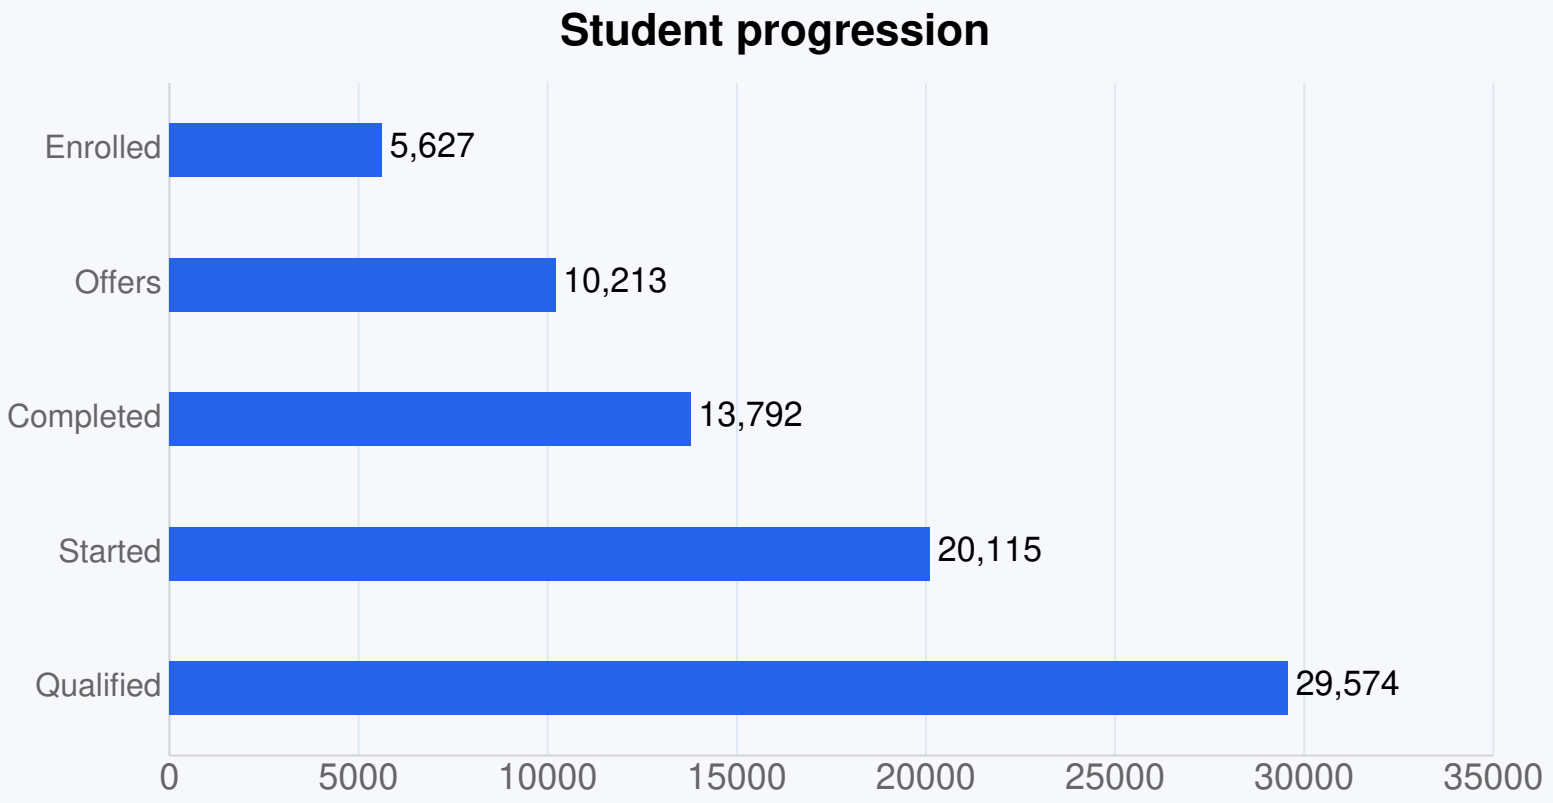

₹3,366 per enrollment

89.4% budget utilization

No tuition revenue or ROI modeled.

Portfolio simulation · reports/kpis.json · all 2025 campaigns

6,323 started applications remain incomplete at the snapshot

68.6% of application starts are completed.

Investigate form friction and follow-up.

Recent students may still progress: this is not a final loss estimate.

Portfolio simulation · reports/03_unique_conversion.csv · all cohorts

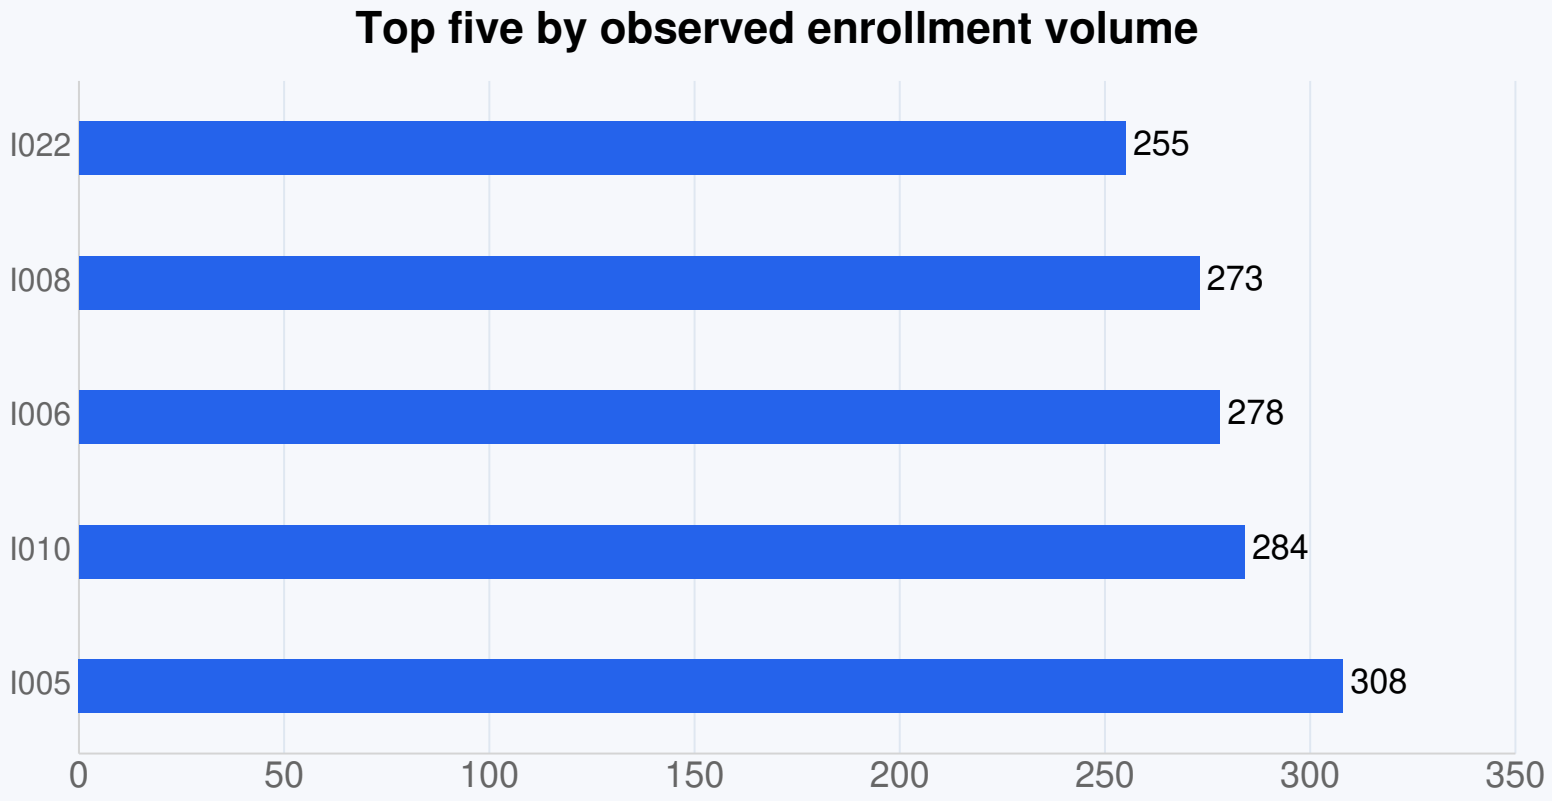

Investigate C007 before committing additional budget

C007: 349 leads, 32 enrollments and ₹2.51 lakh spend. Historical cost per enrollment is ₹7,848.

Completed-application rate: 18.3%, compared with the mature pooled benchmark of 29.1%.

Audit targeting, landing-page qualification and follow-up. Randomize a revised message test before making causal claims.

Institution reports connect client reviews to campaign evidence

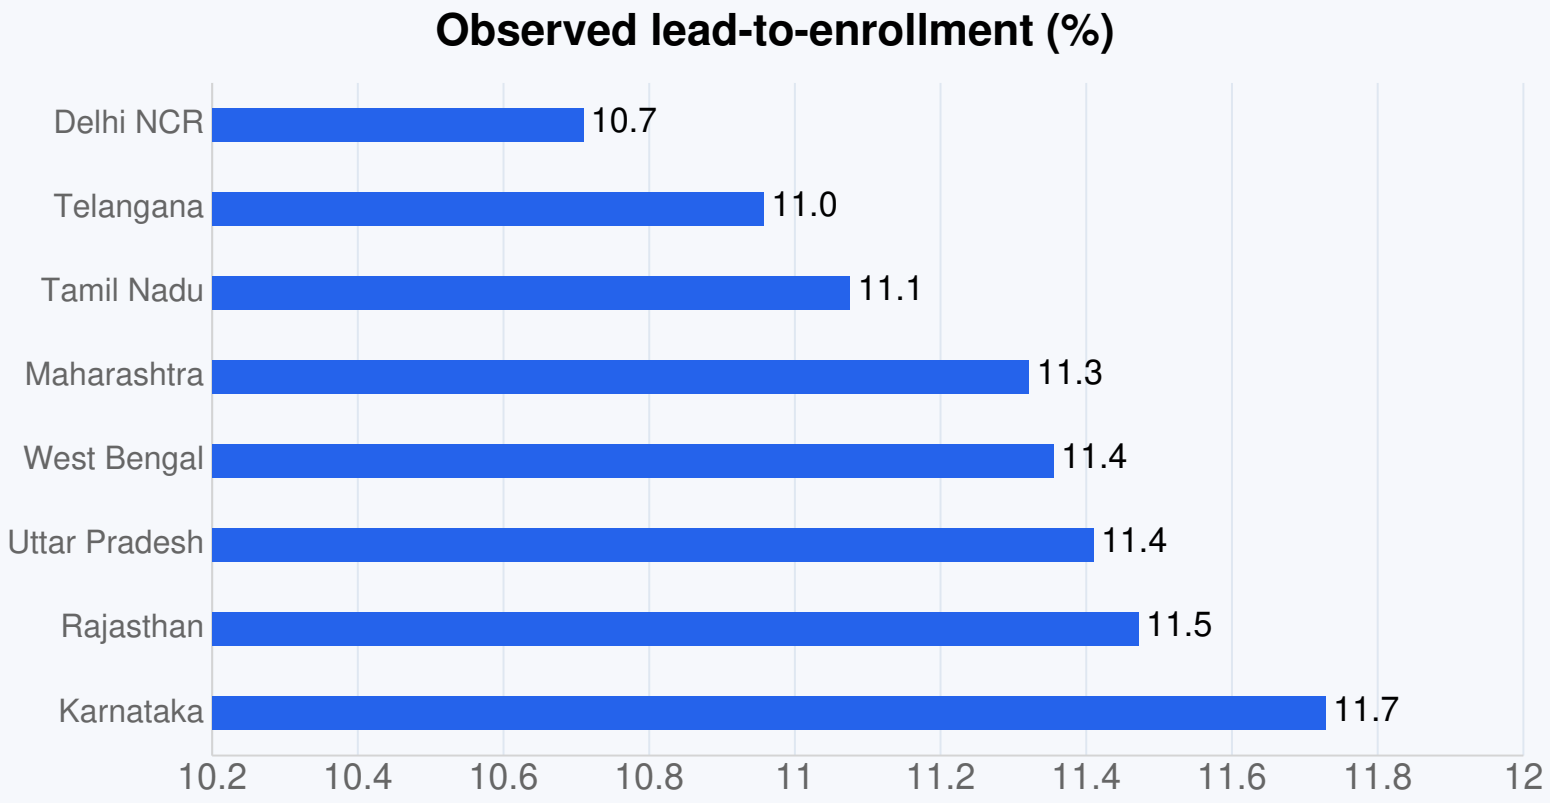

Volume reflects campaign allocation as well as conversion.

Compare cost per application and enrollment alongside volume.

Export institution HTML and CSV packs from the app.

Portfolio simulation · reports/session2/institutions · all 2025 cohorts

Territory differences guide investigation, not market claims

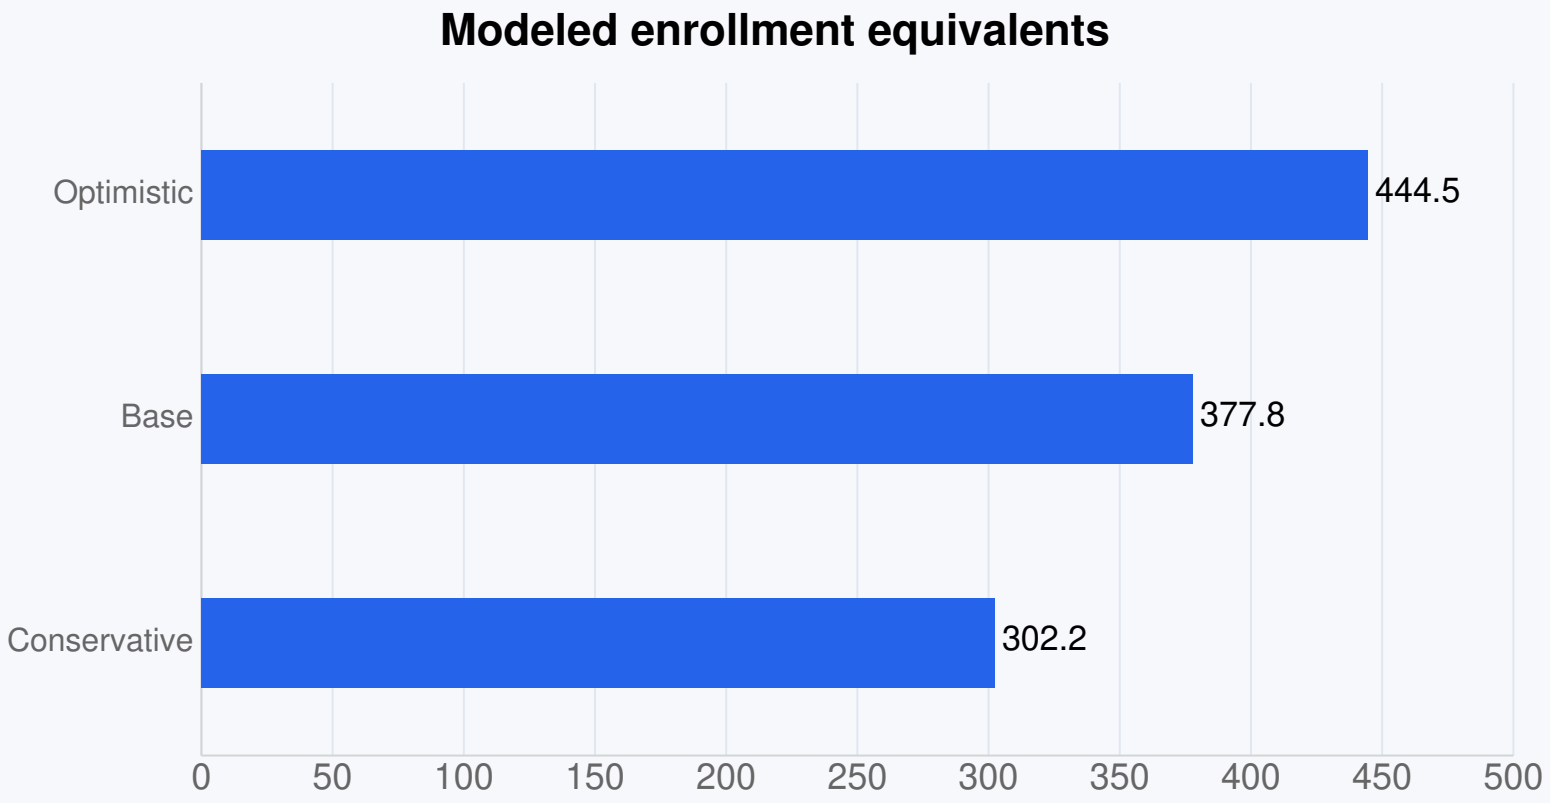

Fictional population and simulated outcomes.

Review mix and maturity before comparing territories.

Geographic cost efficiency is unavailable without delivery-level spend.

Portfolio simulation · reports/session2/geography.csv · all cohorts

A ₹10 lakh planning budget supports explicit cost scenarios

Cost assumptions: +25% / unchanged / −15%.

Lower historical CPE gets priority within limits.

Constant efficiency; no saturation or incremental lift modeled.

Portfolio simulation · src/budget.py · mature history · 5% floor / 25% cap

A practical operating cadence for campaign management

Weekly: review mature campaign flags, qualify high-cost leads and assign ownership for incomplete applications.

Monthly: reconcile SQL, Python and Excel; share scoped institutional reports and distinguish recent cohorts.

Before reallocating: validate capacity and lead quality, then run a controlled channel or campaign test with a defined success metric.

Use the platform as a tested case study, then validate in practice

Delivered: seven dashboard pages, scenario planner, institution exports, Excel reporting and a reproducible SQL/Python pipeline.

Limits: synthetic outcomes, primary-touch attribution, right censoring and constant-efficiency planning. No demonstrated financial return.

Next: connect a consented CRM extract, add delivery-grain costs and estimate response curves only after adequate experiments.
